

HW I - Astrophysical Dynamics

Problem I

Renaming variables for convenience: $\theta \rightarrow o$, $D \rightarrow d$, $\omega \rightarrow w$

$$\text{In[1]:= } \mathbf{x = l \sin[o[t]]}$$

$$\text{Out[1]= } l \sin[o[t]]$$

$$\text{In[2]:= } \mathbf{y = d \cos[w t] - l \cos[o[t]]}$$

$$\text{Out[2]= } d \cos[t w] - l \cos[o[t]]$$

a) Hamiltonian mechanics

The potential energy PE is given by:

$$\text{In[3]:= } \mathbf{PE = -m g y}$$

$$\text{Out[3]= } -g m (d \cos[t w] - l \cos[o[t]])$$

The kinetic energy KE is given by:

$$\text{In[4]:= } \mathbf{KE = P^2 / (2 m)}$$

$$\text{Out[4]= } \frac{p^2}{2 m}$$

The Hamiltonian H is given by:

$$\text{In[5]:= } \mathbf{H = KE + PE}$$

$$\text{Out[5]= } \frac{p^2}{2 m} - g m (d \cos[t w] - l \cos[o[t]])$$

b)

$$\text{In[6]:= } \mathbf{KE = 1 / 2 m (D[x, t]^2 + D[y, t]^2)}$$

$$\text{Out[6]= } \frac{1}{2} m (l^2 \cos[o[t]]^2 o'[t]^2 + (-d w \sin[t w] + l \sin[o[t]] o'[t])^2)$$

Let L be the lagrangian. Then:

$$\text{In[7]:= } \mathbf{L = KE - PE}$$

$$\text{Out[7]= } g m (d \cos[t w] - l \cos[o[t]]) + \frac{1}{2} m (l^2 \cos[o[t]]^2 o'[t]^2 + (-d w \sin[t w] + l \sin[o[t]] o'[t])^2)$$

Momentum p is given by:

```
In[8]:= p = Simplify[D[L, D[o[t], t]]]
```

```
Out[8]:= 1 m (-d w Sin[t w] Sin[o[t]] + 1 o'[t])
```

Hamiltonian H is given by:

```
In[9]:= H = D[o[t], t] D[L, D[o[t], t]] - L
```

```
Out[9]:= -g m (d Cos[t w] - 1 Cos[o[t]]) +
          1
          m o'[t] (2 1^2 Cos[o[t]]^2 o'[t] + 2 1 Sin[o[t]] (-d w Sin[t w] + 1 Sin[o[t]] o'[t])) -
          1
          m (1^2 Cos[o[t]]^2 o'[t]^2 + (-d w Sin[t w] + 1 Sin[o[t]] o'[t])^2)
```

The Euler-Lagrange equation gives:

```
In[10]:= EQ = Simplify[D[D[L, D[o[t], t]], t] - D[L, o[t]] == 0]
```

```
Out[10]:= 1 m (- (g + d w^2 Cos[t w]) Sin[o[t]] + 1 o''[t]) == 0
```

Solving the EL equation for o''[t] we get:

```
In[11]:= S = Solve[EQ, D[o[t], {t, 2}]] [[1]]
```

```
Out[11]:= {o''[t] -> (g + d w^2 Cos[t w]) Sin[o[t]] / 1}
```

```
In[12]:= LHS = o''[t] /. S[[1]]
```

```
Out[12]:= (g + d w^2 Cos[t w]) Sin[o[t]] / 1
```

c) Numerical solution

Substituting values g=1 and l=1

```
In[13]:= eq1 = o''[t] == LHS /. {g -> 1, 1 -> 1}
```

```
Out[13]:= o''[t] == (1 + d w^2 Cos[t w]) Sin[o[t]]
```

NUmerically solving this system using the inbuilt ODE solver in Mathematica:

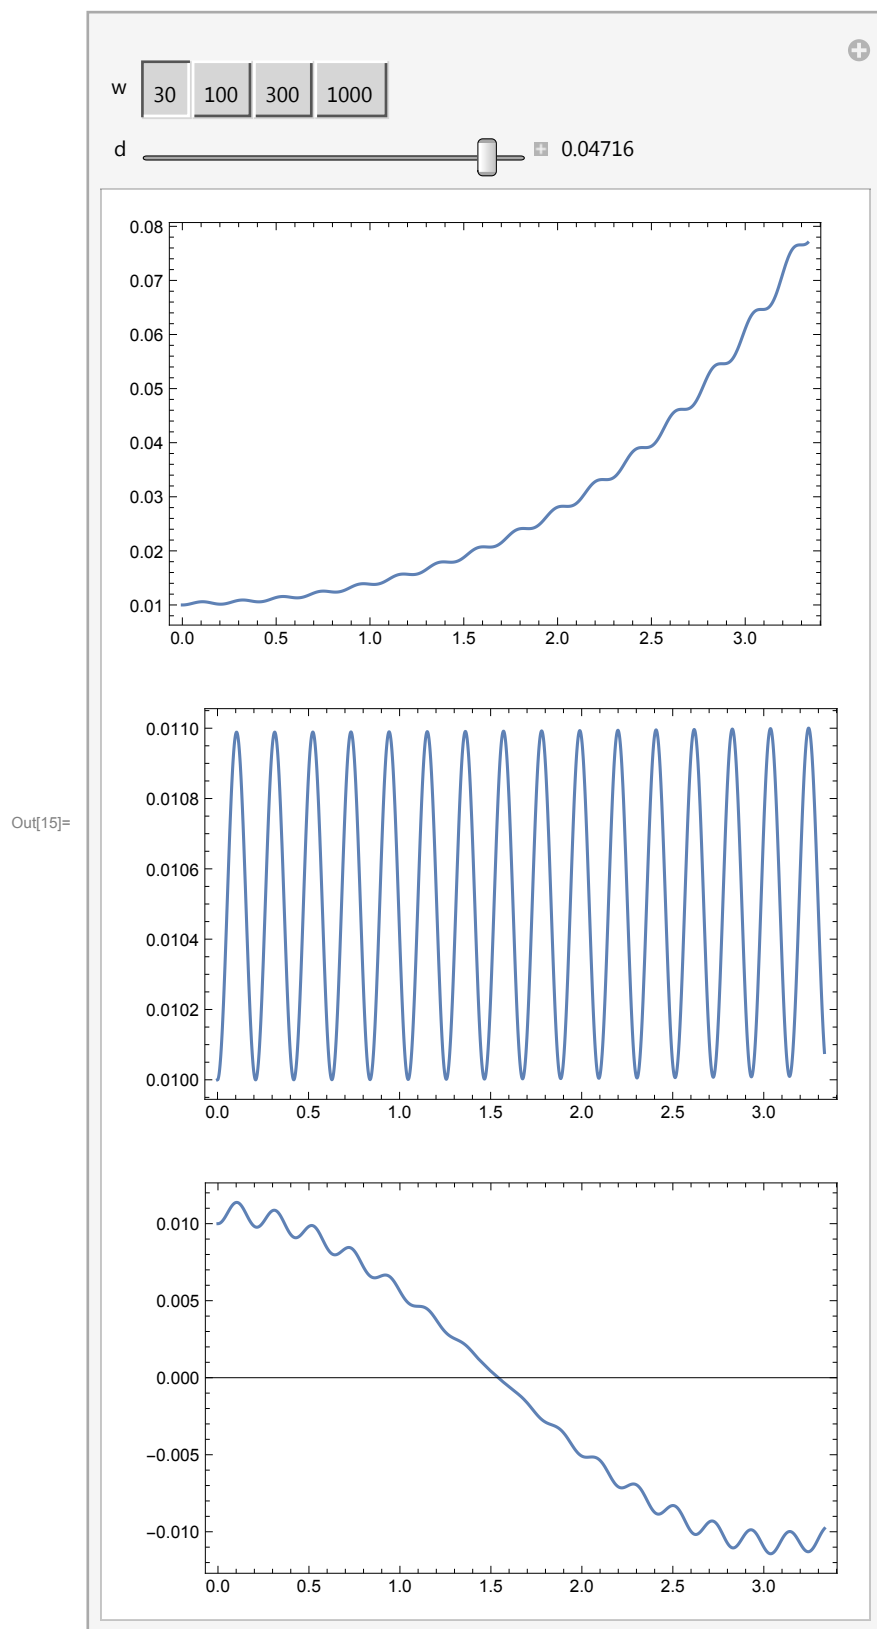

```
In[14]:= sol = ParametricNDSolveValue[{eq1, o[0] == 0.01, o'[0] == 0}, o, {t, 0, 5}, {d, w}]
```

```
Out[14]:= ParametricFunction[ Expression: o  
Parameters: {d, w}]
```

Plots

  {{w, 1000}, {30, 100, 300, 1000}}]

```

For each value of w the transition from exponential growth to periodicity occurs at approximately the value $\sqrt{2}/w$ (as seen in the plots)

Problem 2

■ a)

Position of first mass = x_1 , Position of second mass = x_2 , Vector connecting the two masses = r ,
Position of center of mass = X . (Note that x_1 , x_2 , r , X are all vectors)

Equation of position of center of mass:

$$\begin{aligned} \text{In[1]} &= \mathbf{e1} = \mathbf{X}[t] == (\mathbf{m1} \mathbf{x1}[t] + \mathbf{m2} \mathbf{x2}[t]) / (\mathbf{m1} + \mathbf{m2}) \\ \text{Out[1]} &= \mathbf{X}[t] == \frac{\mathbf{m1} \mathbf{x1}[t] + \mathbf{m2} \mathbf{x2}[t]}{\mathbf{m1} + \mathbf{m2}} \end{aligned}$$

Equation of vector from one body to the other:

$$\begin{aligned} \text{In[2]} &= \mathbf{e2} = \mathbf{r}[t] == \mathbf{x2}[t] - \mathbf{x1}[t] \\ \text{Out[2]} &= \mathbf{r}[t] == -\mathbf{x1}[t] + \mathbf{x2}[t] \end{aligned}$$

Solving for x_1 and x_2 in terms of X and r :

$$\begin{aligned} \text{In[3]} &= \mathbf{s} = \text{Solve}[\{\mathbf{e1}, \mathbf{e2}\}, \{\mathbf{x1}[t], \mathbf{x2}[t]\}] \\ \text{Out[3]} &= \left\{ \left\{ \mathbf{x1}[t] \rightarrow -\frac{\mathbf{m2} \mathbf{r}[t] - \mathbf{m1} \mathbf{X}[t] - \mathbf{m2} \mathbf{X}[t]}{\mathbf{m1} + \mathbf{m2}}, \mathbf{x2}[t] \rightarrow -\frac{-\mathbf{m1} \mathbf{r}[t] - \mathbf{m1} \mathbf{X}[t] - \mathbf{m2} \mathbf{X}[t]}{\mathbf{m1} + \mathbf{m2}} \right\} \right\} \end{aligned}$$

Position of first body in terms of r and X is given by:

$$\begin{aligned} \text{In[4]} &= \mathbf{x1}[t] = \mathbf{x1}[t] /. \mathbf{s}[[1]] \\ \text{Out[4]} &= -\frac{\mathbf{m2} \mathbf{r}[t] - \mathbf{m1} \mathbf{X}[t] - \mathbf{m2} \mathbf{X}[t]}{\mathbf{m1} + \mathbf{m2}} \end{aligned}$$

Position of second body in terms of r and X is given by:

$$\begin{aligned} \text{In[5]} &= \mathbf{x2}[t] = \mathbf{x2}[t] /. \mathbf{s}[[1]] \\ \text{Out[5]} &= -\frac{-\mathbf{m1} \mathbf{r}[t] - \mathbf{m1} \mathbf{X}[t] - \mathbf{m2} \mathbf{X}[t]}{\mathbf{m1} + \mathbf{m2}} \end{aligned}$$

The kinetic energy KE is then given by:

$$\begin{aligned} \text{In[6]} &= \mathbf{KE} = \text{Simplify}\left[\frac{1}{2} (\mathbf{m1} \mathbf{D}[\mathbf{x1}[t], t]^2 + \mathbf{m2} \mathbf{D}[\mathbf{x2}[t], t]^2)\right] \\ \text{Out[6]} &= \frac{\mathbf{m1} \mathbf{m2} \mathbf{r}'[t]^2 + (\mathbf{m1} + \mathbf{m2})^2 \mathbf{X}'[t]^2}{2 (\mathbf{m1} + \mathbf{m2})} \end{aligned}$$

Since $\mathbf{X}'[t] = \mathbf{Vcm}$, we can write KE as:

$$\begin{aligned} \text{In[7]} &= \mathbf{KE} = \mathbf{KE} /. \{\mathbf{X}'[t] \rightarrow \mathbf{Vcm}[t]\} \\ \text{Out[7]} &= \frac{(\mathbf{m1} + \mathbf{m2})^2 \mathbf{Vcm}[t]^2 + \mathbf{m1} \mathbf{m2} \mathbf{r}'[t]^2}{2 (\mathbf{m1} + \mathbf{m2})} \end{aligned}$$

Now in spherical coordinates r is can be written as: (where we have renamed for convinience the angles $\theta \rightarrow A$ and $\phi \rightarrow B$).

$$\begin{aligned} \text{In[8]} &= \mathbf{r}[t_] = \mathbf{R}[t] \{\mathbf{Sin}[A[t]] \mathbf{Cos}[B[t]], \mathbf{Sin}[A[t]] \mathbf{Sin}[B[t]], \mathbf{Cos}[A[t]]\} \\ \text{Out[8]} &= \{\mathbf{Cos}[B[t]] \mathbf{R}[t] \mathbf{Sin}[A[t]], \mathbf{R}[t] \mathbf{Sin}[A[t]] \mathbf{Sin}[B[t]], \mathbf{Cos}[A[t]] \mathbf{R}[t]\} \end{aligned}$$

This gives KE in terms of R, A and B as:

$$\text{In[9]:= KE = Simplify}\left[\frac{(m1 + m2)^2 V_{cm}[t]^2 + m1 m2 \mathbf{r}'[t] \cdot \mathbf{r}'[t]}{2 (m1 + m2)}\right]$$

$$\text{Out[9]= } \frac{1}{2 (m1 + m2)} \left((m1 + m2)^2 V_{cm}[t]^2 + m1 m2 \left(R[t]^2 \left(A'[t]^2 + \sin[A[t]]^2 B'[t]^2 \right) + R'[t]^2 \right) \right)$$

Potential energy (PE) is given by:

$$\text{In[10]:= PE = -G m1 m2 / R[t]}$$

$$\text{Out[10]= } -\frac{G m1 m2}{R[t]}$$

Thus the total hamiltonian in terms of R, A and B is:

$$\text{In[11]:= H = KE + PE}$$

$$\text{Out[11]= } -\frac{G m1 m2}{R[t]} + \frac{1}{2 (m1 + m2)} \left((m1 + m2)^2 V_{cm}[t]^2 + m1 m2 \left(R[t]^2 \left(A'[t]^2 + \sin[A[t]]^2 B'[t]^2 \right) + R'[t]^2 \right) \right)$$

This is independent of the position of the center of mass (X). It can be seen the the orbital motion and the center of mass motion is entirely decoupled. Thus H can be written as the sum of two parts corresponding to each motion.

Moving to center of mass frame we can take $V_{cm}=0$. The KE in this frame is then dependent only on the particle separation. Thus the orbital motion is independent of motion of center of mass. The Hamiltonian in center of mass frame is given by:

$$\text{In[12]:= H = H /. {Vcm[t] -> 0}$$

$$\text{Out[12]= } -\frac{G m1 m2}{R[t]} + \frac{m1 m2 \left(R[t]^2 \left(A'[t]^2 + \sin[A[t]]^2 B'[t]^2 \right) + R'[t]^2 \right)}{2 (m1 + m2)}$$

■ b)

i.

We can see that the Hamiltonian is also independent of B[t]. Therefore the corresponding angular momentum is conserved. Hence the motion is confined to a plane.

ii

Let the the components of momentum be given by $P_R \rightarrow PR$, $P_\theta \rightarrow PA$ and $P_\phi \rightarrow PB$

Let L be the lagrangian. In the center of mass frame L is given by:

$$\text{In[13]:= } \mathbf{L} = \mathbf{KE} - \mathbf{PE} /. \{\mathbf{Vcm}[t] \rightarrow 0\}$$

$$\text{Out[13]= } \frac{G m_1 m_2}{R[t]} + \frac{m_1 m_2 \left(R[t]^2 \left(A'[t]^2 + \sin[A[t]]^2 B'[t]^2 \right) + R'[t]^2 \right)}{2 (m_1 + m_2)}$$

Calculating the momentum from L gives:

$$\text{In[14]:= } \mathbf{PA}[t] == \mathbf{D}[\mathbf{L}, \mathbf{D}[\mathbf{A}[t], t]]$$

$$\text{Out[14]= } \mathbf{PA}[t] == \frac{m_1 m_2 R[t]^2 A'[t]}{m_1 + m_2}$$

$$\text{In[15]:= } \mathbf{PB}[t] == \mathbf{D}[\mathbf{L}, \mathbf{D}[\mathbf{B}[t], t]]$$

$$\text{Out[15]= } \mathbf{PB}[t] == \frac{m_1 m_2 R[t]^2 \sin[A[t]]^2 B'[t]}{m_1 + m_2}$$

$$\text{In[16]:= } \mathbf{PR}[t] == \mathbf{D}[\mathbf{L}, \mathbf{D}[\mathbf{R}[t], t]]$$

$$\text{Out[16]= } \mathbf{PR}[t] == \frac{m_1 m_2 R'[t]}{m_1 + m_2}$$

Thus we can write the hamiltonian in terms of PA, PB, PR, A, B, and R as

$$\begin{aligned} \text{In[17]:= } \mathbf{H} = & -\frac{G m_1 m_2}{R[t]} + \\ & \frac{1}{2 m_1 m_2} \left(\mathbf{PR}[t]^2 + \mathbf{PA}[t]^2 / R[t]^2 + \mathbf{PB}[t]^2 / \left(R[t]^2 \sin[A[t]]^2 \right) \right) (m_1 + m_2) \\ \text{Out[17]= } & \frac{(m_1 + m_2) \left(\mathbf{PR}[t]^2 + \frac{\mathbf{PA}[t]^2}{R[t]^2} + \frac{\csc[A[t]]^2 \mathbf{PB}[t]^2}{R[t]^2} \right)}{2 m_1 m_2} - \frac{G m_1 m_2}{R[t]} \end{aligned}$$

From hamilton's equations we get:

$$\text{In[18]:= } \mathbf{D}[\mathbf{PB}[t], t] == -\mathbf{D}[\mathbf{H}, \mathbf{B}[t]]$$

$$\text{Out[18]= } \mathbf{PB}'[t] == 0$$

Thus PB is conserved and the motion is confined to a plane. Therefore we can reorient our axis in a way such that $\mathbf{PB}[t] = 0$.

$$\text{In[19]:= } \mathbf{D}[\mathbf{PA}[t], t] == -\mathbf{D}[\mathbf{H}, \mathbf{A}[t]] == 0$$

$$\text{Out[19]= } \mathbf{PA}'[t] == \frac{(m_1 + m_2) \cot[A[t]] \csc[A[t]]^2 \mathbf{PB}[t]^2}{m_1 m_2 R[t]^2} == 0$$

Thus in the new coordinate system with $\mathbf{PB}[t]=0$, $\mathbf{PA}'[t]$ is also equal to zero.

Hence total angular momentum is conserved.

iii)

From lagrangian dynamics we get:

$$\text{In[20]:= } \mathbf{PA}[t] == \mathbf{D}[\mathbf{L}, \mathbf{D}[\mathbf{A}[t], t]]$$

$$\text{Out[20]= } \mathbf{PA}[t] == \frac{m_1 m_2 R[t]^2 A'[t]}{m_1 + m_2}$$

We have shown that $\mathbf{PA}'[t] = 0$. Therefore $\mathbf{PA}[t] = \text{constant}$. This implies:

$$\text{In[21]:= } \mathbf{PA[t]} == \frac{m1 m2 R[t]^2 A'[t]}{m1 + m2} == C$$

$$\text{Out[21]= } \mathbf{PA[t]} == \frac{m1 m2 R[t]^2 A'[t]}{m1 + m2} == C$$

Let rate of change of area swept per time = Y. Then

$$\text{In[22]:= } \mathbf{Y = 1 / 2 R[t]^2 A'[t]}$$

$$\text{Out[22]= } \frac{1}{2} R[t]^2 A'[t]$$

From the previous equation we get:

$$\text{In[23]:= } \mathbf{Y == 1 / 2 C (m1 + m2) / (m1 m2)}$$

$$\text{Out[23]= } \frac{1}{2} R[t]^2 A'[t] == \frac{C (m1 + m2)}{2 m1 m2}$$

Thus Y is a constant. Kepler's second law is obeyed.

■ c)

Since the motion is confined to a plane, the lagrangian in terms of R and B (angle in the plane) is given by:

$$\text{In[24]:= } \mathbf{L = L /. \{A'[t] \rightarrow 0, A[t] \rightarrow \text{Pi} / 2\}}$$

$$\text{Out[24]= } \frac{G m1 m2}{R[t]} + \frac{m1 m2 (R[t]^2 B'[t]^2 + R'[t]^2)}{2 (m1 + m2)}$$

The angular momentum J is given by:

$$\text{In[25]:= } \mathbf{J == D[L, D[B[t], t]]}$$

$$\text{Out[25]= } \mathbf{J == \frac{m1 m2 R[t]^2 B'[t]}{m1 + m2}}$$

Let u be the reduced mass of the system:

$$\text{In[26]:= } \mathbf{u == m1 m2 / (m1 + m2)}$$

$$\text{Out[26]= } \mathbf{u == \frac{m1 m2}{m1 + m2}}$$

Let us define the constant k as:

$$\text{In[27]:= } \mathbf{k == G m1 m2}$$

$$\text{Out[27]= } \mathbf{k == G m1 m2}$$

This gives the total energy En as:

$$\text{In[28]:= } \mathbf{En == 1 / 2 u R'[t]^2 + J^2 / (2 u R[t]^2) - k / R[t]}$$

$$\text{Out[28]= } \mathbf{En == \frac{J^2}{2 u R[t]^2} - \frac{k}{R[t]} + \frac{1}{2} u R'[t]^2}$$

This gives the change in angle B as R goes from R_{\min} to R_B (R at angle B) as:

$$\text{In[29]:= } \mathbf{B == J / (\text{Sqrt}[2] u) \text{Integrate}[1 / (R^2 \text{Sqrt}[En + k / R - J^2 / (2 u R^2)]), \{R, R_{\min}, R_B\}]}$$

Calculating the integral gives:

$$\text{In[30]:= } \frac{1}{R} == \frac{u k^2}{J^2} + \frac{1}{R_{\text{Min}}} - \frac{u k}{J^2} \cos[B]$$

$$\text{Out[30]= } \frac{1}{R} == \frac{k^2 u}{J^2} + \cos[B] \left(-\frac{k u}{J^2} + \frac{1}{R_{\text{Min}}} \right)$$

This is the equation of a conic section which is an ellipse for $e < 1$

$$\text{In[31]:= } R[B] == \frac{p}{1 + e \cos[B]}$$

$$\text{Out[31]= } R[B] == \frac{p}{1 + e \cos[B]}$$

where p is the latus rectum and e is the eccentricity which have the values:

$$\text{In[32]:= } p = \frac{J^2}{u k}$$

$$\text{Out[32]= } \frac{J^2}{k u}$$

$$\text{In[33]:= } e = \sqrt{1 + \frac{2 E n J^2}{m k^2}}$$

$$\text{Out[33]= } \sqrt{1 + \frac{2 E n J^2}{k^2 m}}$$

The semi major axis is then given by

$$\text{In[34]:= } a = \frac{p}{1 - e^2}$$

$$\text{Out[34]= } -\frac{k m}{2 E n u}$$

Area of the ellipse is given by:

$$\text{In[35]:= } \text{area} = \pi a^2 \sqrt{1 - e^2} // \text{Simplify}$$

$$\text{Out[35]= } \frac{k^2 \sqrt{-\frac{E n J^2}{k^2 m}} m^2 \pi}{2 \sqrt{2} E n^2 u^2}$$

Time taken to complete one full orbit (T) is equal to area divided by rate of change of area swept per unit time (Y)

Y is given by:

$$\text{In[36]:= } Y$$

$$\text{Out[36]= } \frac{1}{2} R[t]^2 A'[t]$$

Angular momentum J was shown to be:

$$\text{In[37]:= } J == u R[t]^2 A'[t]$$

$$\text{Out[37]= } J == u R[t]^2 A'[t]$$

Therefore

$$\text{In[38]:= } Y = \frac{J}{2 m}$$

$$\text{Out[38]= } \frac{J}{2 m}$$

In[39]:= **T = area / Y // Simplify**

Out[39]=
$$\frac{J^3 m \pi}{\sqrt{2} k^2 \left(-\frac{E n J^2}{k^2 m} \right)^{3/2} u^2}$$

Thus we get T is proportional to $E n^{-3/2}$. We have shown previously that the semi major axis a is inversely proportional to En. Therefore we get Kepler's third law i.e T^2 proportional to a^3 .
